

New Vegetation Management Herbicides from DuPont

Ronnie G. Turner and Stephen F Colbert, DuPont Crop Protection

Registration of four new vegetation management herbicides from DuPont is anticipated to occur in early 2011. The new products combine the proven efficacy of DuPont's sulfonylurea herbicides with the new active ingredient aminocyclopyrachlor. Aminocyclopyrachlor is a new auxin mimic herbicide discovered by DuPont Crop Protection. It combines foliar and residual activity with upward and downward movement to provide excellent annual and perennial broadleaf and brush control.

- DuPont™ Plainview™ herbicide is a broad-spectrum bareground weed control product designed specifically to help utility and industrial site managers improve site safety.
- DuPont™ Viewpoint™ herbicide delivers broad-spectrum brush control for greater safety at utility sites and along roadways.
- DuPont™ Streamline™ herbicide was designed to help land managers maintain desired grasses without sacrificing brush control.
- DuPont™ Perspective™ herbicide controls invasive weeds and helps restore desirable grasses to more natural habitats.
